- Importance of Transport
 - SDG9
 - Sendai, SDG11,
 - Significant investments - Fiji **30%** of public spending on transport
- Low income countries
 - Need to spend 0.5 – 3.3% of GDP annually on transportation (US\$157bn – US\$1tn) + 1 – 2% for maintenance
 - Investment needs are the highest, but risk assessments are scarce and disasters impacts on the economy are typically underestimated
- Existing global studies
 - single aspects (buildings, pop exposed,...)
 - single hazards (flood risk)

Data

Earthquakes
(4 return periods)

PGA
Liquefaction

Cyclones
(5 return periods)

Wind speed

Flooding

Analysis

Intersection

Loss calculation

Risk and uncertainty

Output metrics

Annual infrastructure asset exposure

Expected Annual Damages (EAD)

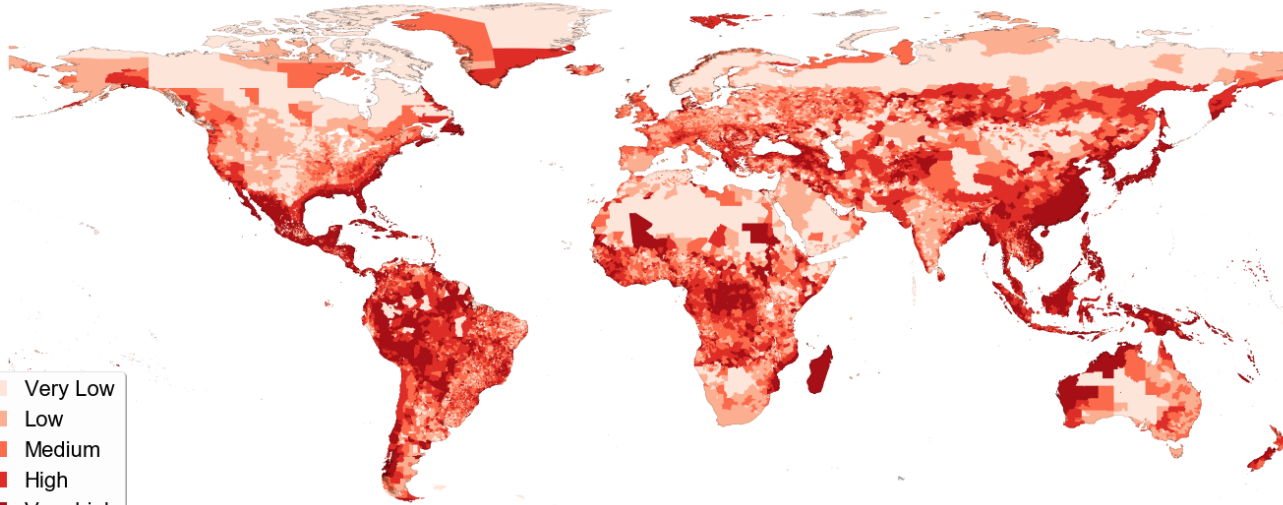

Sensitivity of EAD

Multi-hazard Exposure

A)

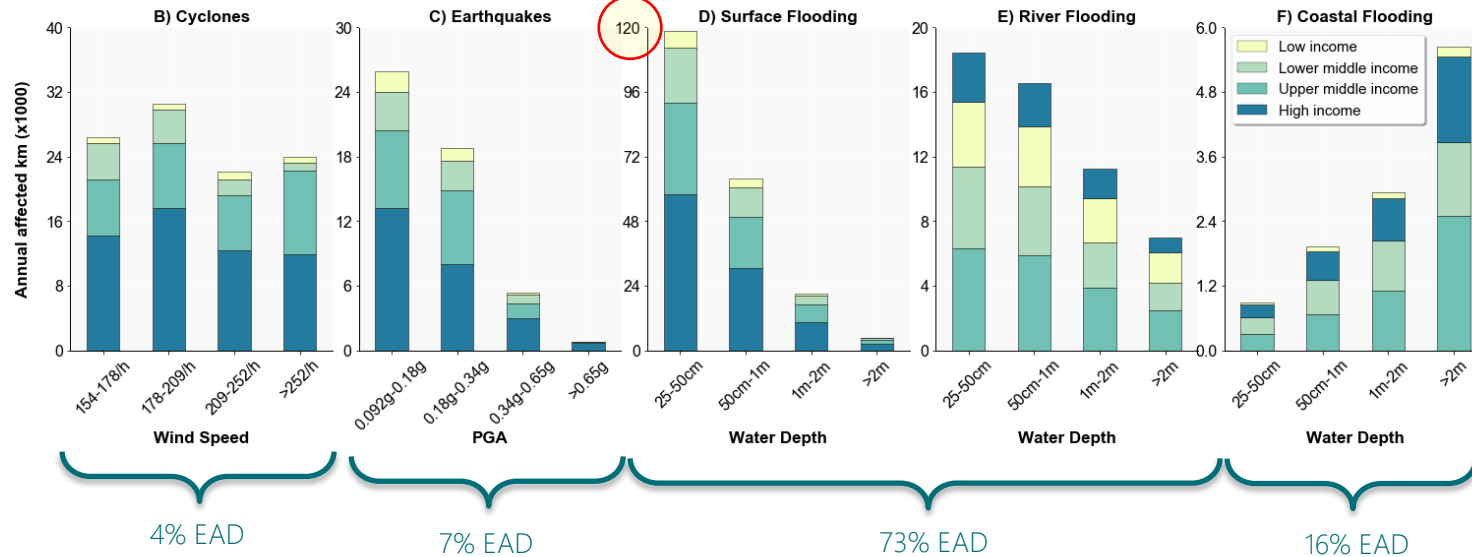

46,566 regions

>50 million km

27% exposed ≥ 1 hazard (250yr)

7.5% exposed to 100-yr flood

0.5% of global assets exposed p.a. (3.1-22 billion USD)

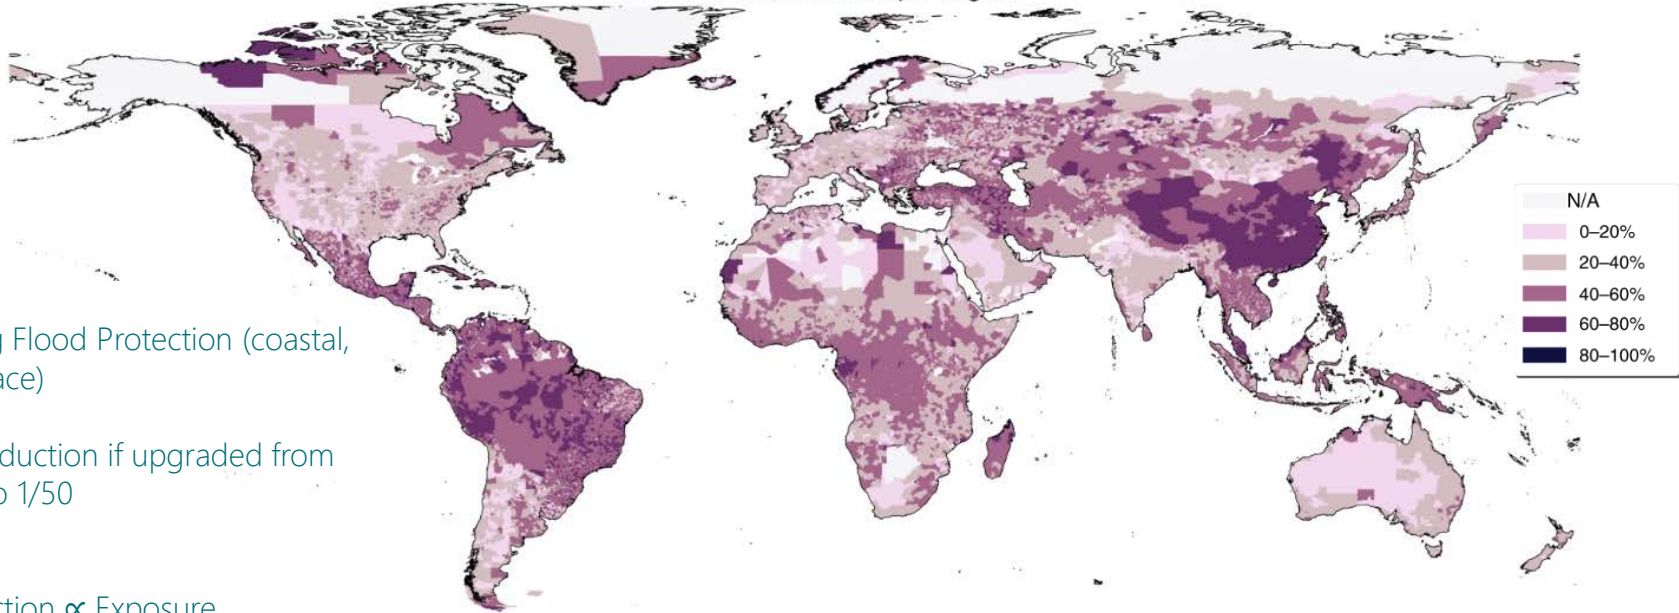

Expected Annual Damage

High Income
 Upper Middle
 Lower Middle
 Low Income

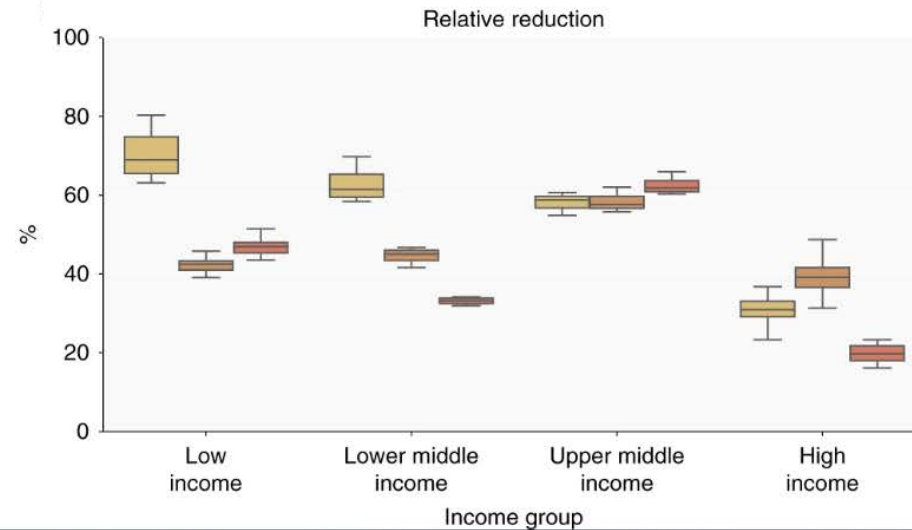

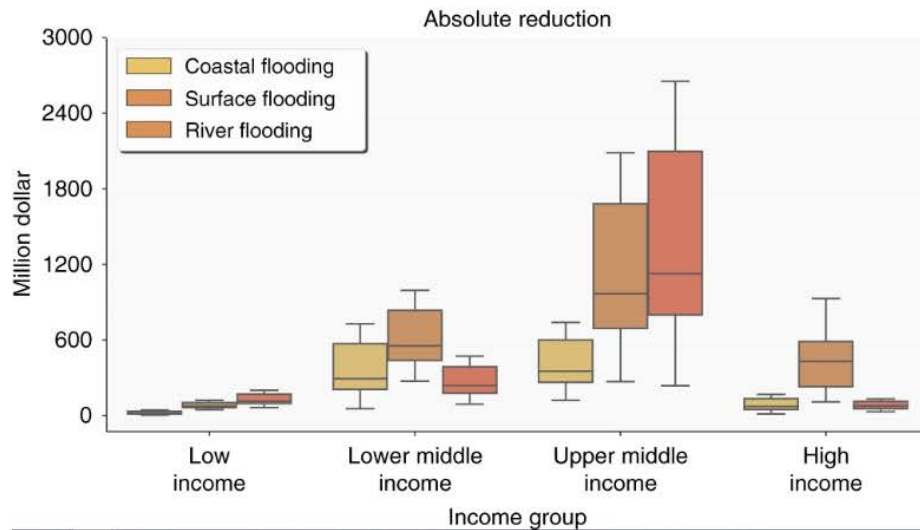

Relative reduction in risk per region

Increasing Flood Protection (coastal, river, surface)

- 42% reduction if upgraded from 1/100 to 1/50

Risk reduction \propto Exposure

- Importance of targeting exposed roads for maximum BCR
 - 2% spending of road value on drainage → positive BCR for 60% of exposed roads (even better if targeted further)
 - Low-regrets options
 - Local hazard maps
- Sensitivity
 - Roads: fragility and repair costs
 - Bridges: reconstruction costs
 - Location specific costs and fragility?
- EAD (3.1-22 billion) is small = 0.2-1.5% of maintenance
 - prioritise regular maintenance over resilience building?
