2010 Canterbury Earthquake

- 4 September 2010
- Magnitude 7.1 (M_L)
- Earthquake's epicenter was 40 kilometers west of Christchurch, near the town of **Darfield**.
- 100 people were injured, no death
- Highway **bridges** generally performed well
- NZTA retrofit programme has been very successful
- NZTA had **\$6 million** in damage

2011 Canterbury Earthquake

- Tuesday 22 February 2011
- Magnitude 6.3 (M_L)
- Killed 182 people
- Economic Impact: \$40 billion (~17% NZ GDP)
- Local roads: 83 sections of 57 roads were closed.
- Five of the 6 bridges crossing the Lower Avon were closed, many weight restriction (Giovinazzi et al., 2011)
- NZTA had \$40 million in damage(Eidinger and Tang, 2012)

2016 Kaikoura Earthquake

- Midnight on 14 Nov. 2016
- Magnitude 7.8 (MMS, M_W)
- 2 fatalities and 57 injuries
- At least 12 surface faults ruptured on and offshore
- Initial estimates suggest between 80,000 and 100,000 landslides
- Five landslides were more than 1,000,000 m³ in size

2016 Kaikoura Earthquake

RNC/QuakeCoRE Distributed Infrastructure Monthly Meeting
Monday 12 Mar 2018

• SH1 was by far the **shortest road route between Picton** and Christchurch at around 3 ½ hours, with the closest State Highway alternative route taking around 6 ½ hours.

Day 100 (21 Feb 2017) Road Closed: SH Open daytime: SH Open: SH Open: Local Vehicle & passenger ferrie Full service Commercial flights ---- Regular service ---- Temporary service

Day 2 (15 Nov 2016)

Level-of-service on Day 2 (15th November 2016) (Davis, et al, 2017)

Level-of-service on Day 100 (21st February 2017) (*Davis*, *et al*, 2017).

Literature Review

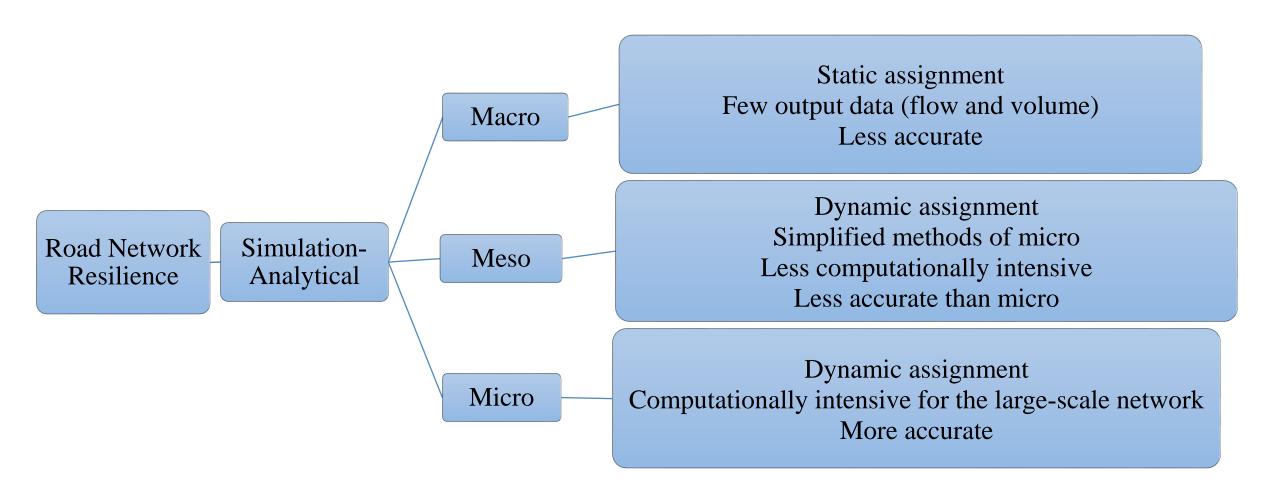

Concept	Definition		
Vulnerability	"A susceptibility that can result in considerable reductions in road network serviceability". (Berdica, 2002)		
Resilience	Treasury's National infrastructure plan (NIP): The capacity of public, private and civic sectors to withstand disruption, absorb disturbance, act effectively in a crisis, adapt to changing conditions, including climate change, and grow over time.		

Literature Review

RNC/QuakeCoRE Distributed Infrastructure Monthly Meeting Monday 12 Mar 2018

General assessment of the network based on expertise ideas Conceptual Qualitative Do not consider operational performance Road Network Resilience Computationally intensive Analytical Not appropriate to model the large-scale network traffic performance

Literature Review

Aim and Objectives

RNC/QuakeCoRE Distributed Infrastructure Monthly Meeting Monday 12 Mar 2018

• Main Aim:

• Assess the **operational resilience** of a **rural road network** in the South Island, New Zealand, in the event of a **major earthquake**.

Objectives:

- Development of a framework and performance measures to evaluate resilience of rural road network in an event of disasters
- Development and application of a hybrid simulation approach to model postdisaster transport network performance
- Evaluation of transport network operational performance for potential earthquake scenarios

Supply Data

RNC/QuakeCoRE Distributed Infrastructure Monthly Meeting

Monday 12 Mar 2018

Origin-Destination
Data

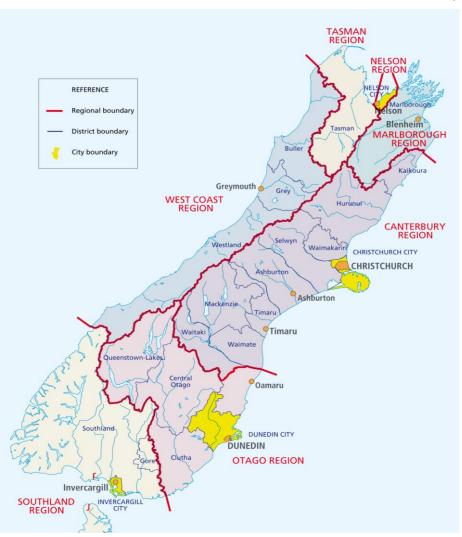

- **Population** of South Island: 1,004,400 (2013 census)
- Seven regions and 23 Districts (Canterbury, Otago, Southland, West Coast, Malborough, Nelson, and Tasman)

ENGINEERING

DEPARTMENT OF CIVIL AND
ENVIRONMENTAL ENGINEERING

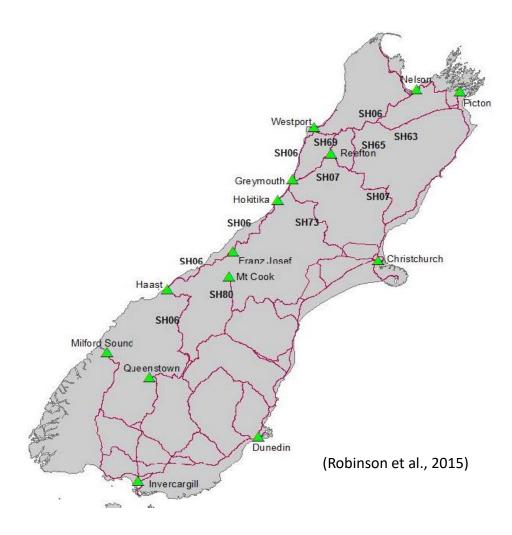

Road Network

- The South Island State Highway network comprises long, thin corridor routes with little redundancy; there are only three routes that cross the Southern Alps connecting the east and west coasts (Robinson et al., 2015).
- Mining, agriculture, and tourism

Required Data

	Modelling Steps	Types of Data
Data Requirements	Development	 Road network map GIS centreline of road network RAAM data (# of lanes, grade, speed limit) Capacity, Jam density Signal control data OD matrix
	Creating the OD matrix	 Inter-city travel time profile Population of cities Number of tourists Number of freight Export and import value Number of paid employees Number of business locations Total households Traffic count data

Check The Errors

AIMSUN

RNC/QuakeCoRE Distributed Infrastructure Monthly Meeting Monday 12 Mar 2018

The AIMSUN hybrid simulator gives simultaneous microscopic and mesoscopic simulation, allowing to model large areas while zooming in on all areas that require a finer level of detail.

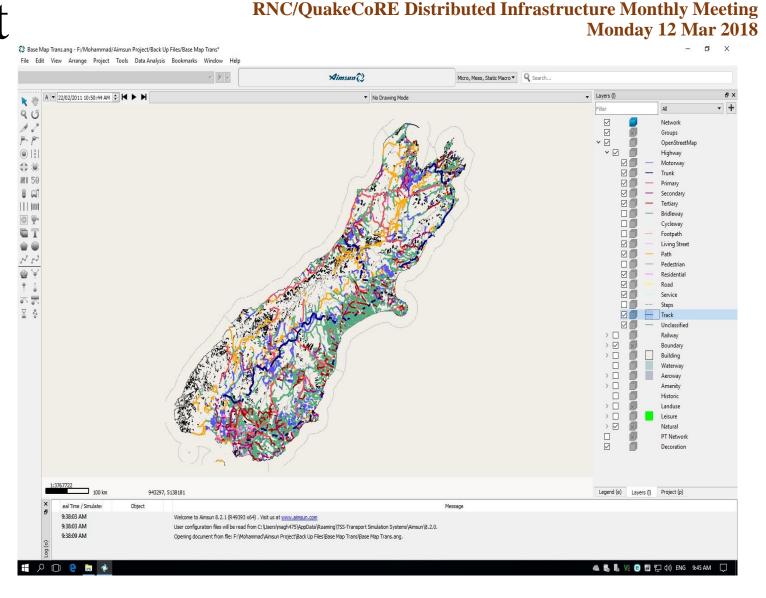

Model Development

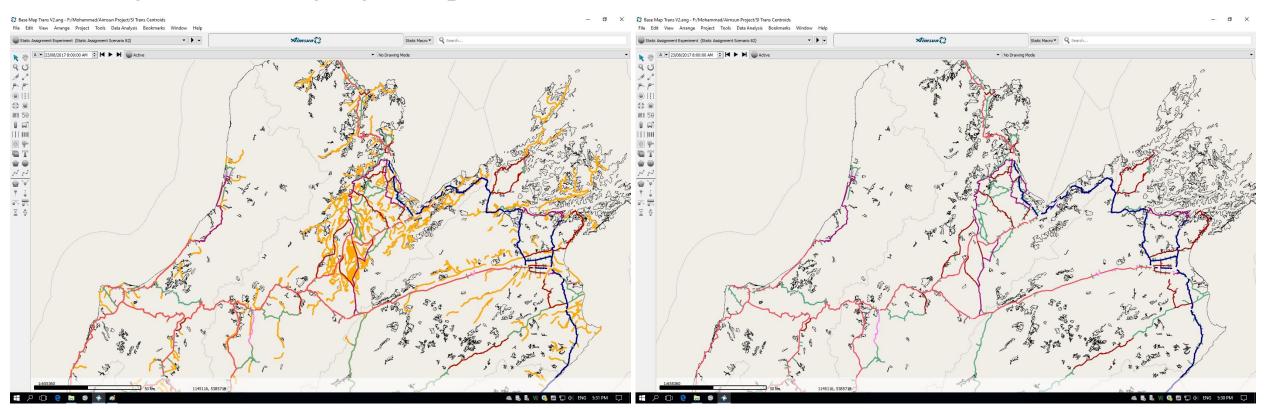

- Open Street Map (OSM) file
- New Zealand road centerline GIS shapefile
- Check the features

Model Simplification

- Urban/Rural
- NZTA One Network Road Classification (ONRC)
- Google Earth and google Map

Supply Data

Develop and Simplify
a Base Model

Calibration

RNC/QuakeCoRE Distributed Infrastructure Monthly Meeting

Calibration

- Calibration the network on macroscopic level
- Calibration the network on mesoscopic level
- Calibration the network on hybrid level

- Count data
- Goodness of fit
- NZTA Transport model development guidelines

Develop and Simplify a Base Model

Calibration

Validation

Validation

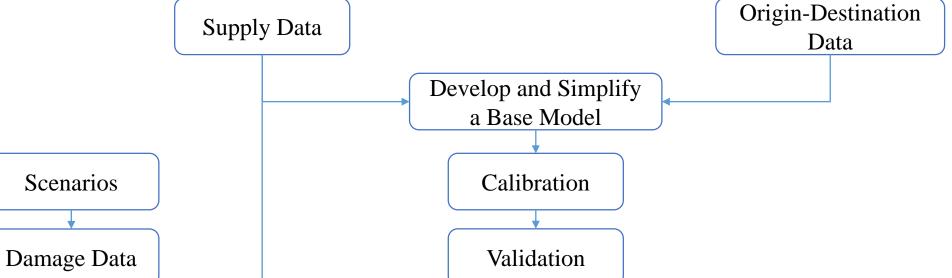

- Validate the network based on normal conditions
- Validate the network based on Kaikoura Earthquake

Post-Disaster

Supply Data

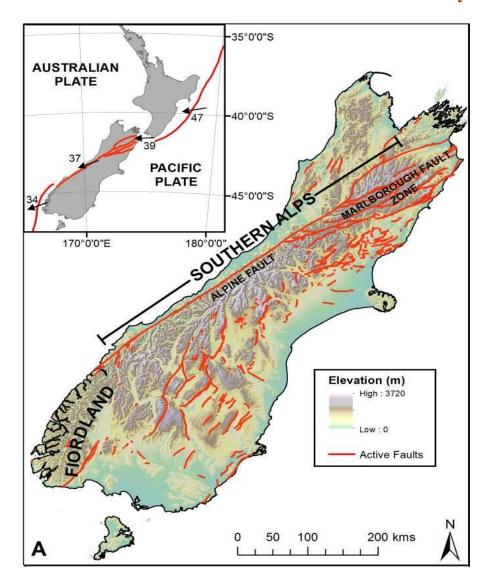

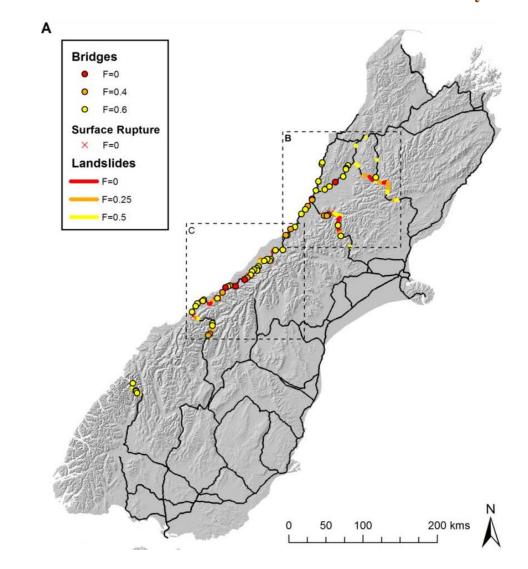

Scenarios

- Alpine Fault M8 Earthquake (AF8)
- The most probable and anticipated earthquakes
- Berryman et al. (2014): the probability of occurrence in the next 50 years as 30% with possibly more than \$10 billion economic cost
- Developed by Robinson et al. (2016) or Alistair's PhD outputs

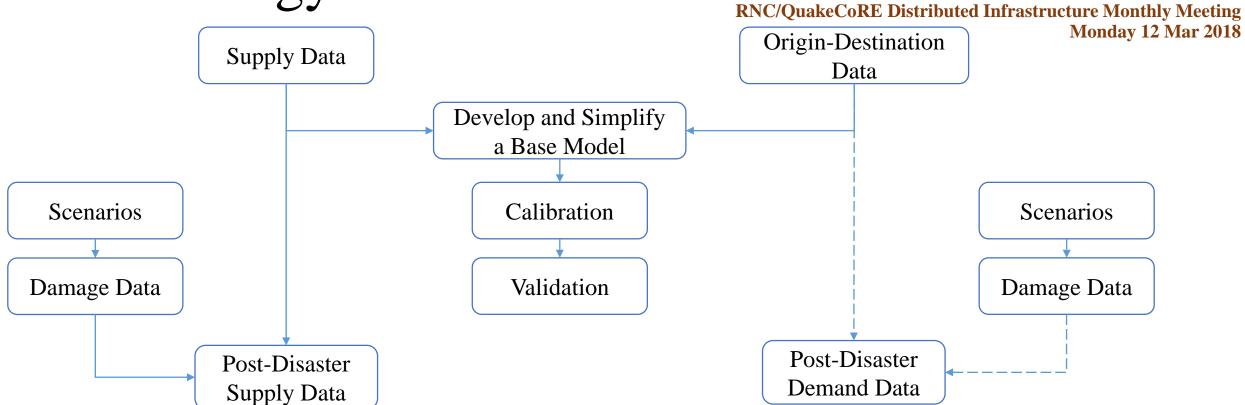

Scenarios

- Different time periods, T=0, 3, 14, 30, and 90 days after the event.
- The performance of bridges, with only 9% catastrophic loss (F=0)
- Minor damage of bridges and imposed weight or speed restrictions (F=0.4)
- Completely blocked locations due to landslides (F=0)
