

# Topography Effects on Ground Motion

## Simulation and analysis plans

Caltech: Kami Mohammadi  
Domniki Asimaki

U. Canterbury: Seokho Jeong  
Brendon Bradley

U. Memphis: Khurram Aslam  
Ricardo Taborda

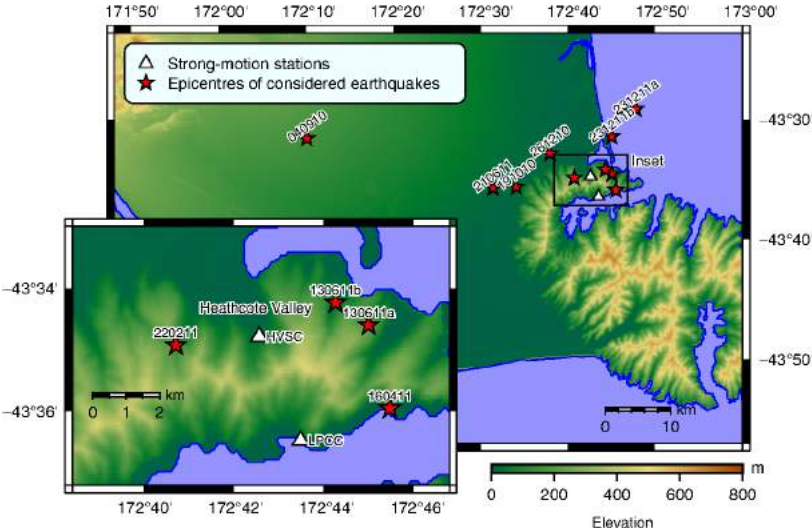

## U. Canterbury – Summary of Progress and Plans

- Done:
  - Conducted experimental measurements in Heathcote Valley
  - Adopted SPECFEM3D for New Zealand simulations with topography
  - Built meshes for for SPECFEM3D using SIVM data (not trivial)
- In progress:
  - Submission of a manuscript on experimental results about topography effects
- Plans for this year:
  - Adapt to use of finite fault models in SPECFEM3D
  - Compare with other simulations (e.g., Hercules)
  - Compare results with data (qualitatively)

## Caltech – Summary of Progress and Plans

- Done:
  - Analysis of experimental data with U. Canterbury (S. Jeong)
  - 2D/3D numerical simulations using...
    - 8-m DEM for surface geometry
    - CPT and HVSR data for simple material model
    - Superposition of Ricker pulses with energy in 0.1–20 Hz
    - SV (2D) and SH (3D) plane waves for variable incident angle
  - Comparisons with experimental results are in good agreement based on what can be expected from the model.
- In progress:
  - Further refinement of SH model and results
  - Submission of a two-parts manuscript (review and experimental/numerical results)

# Region of Interest, Instrumentation, 2D Modeling

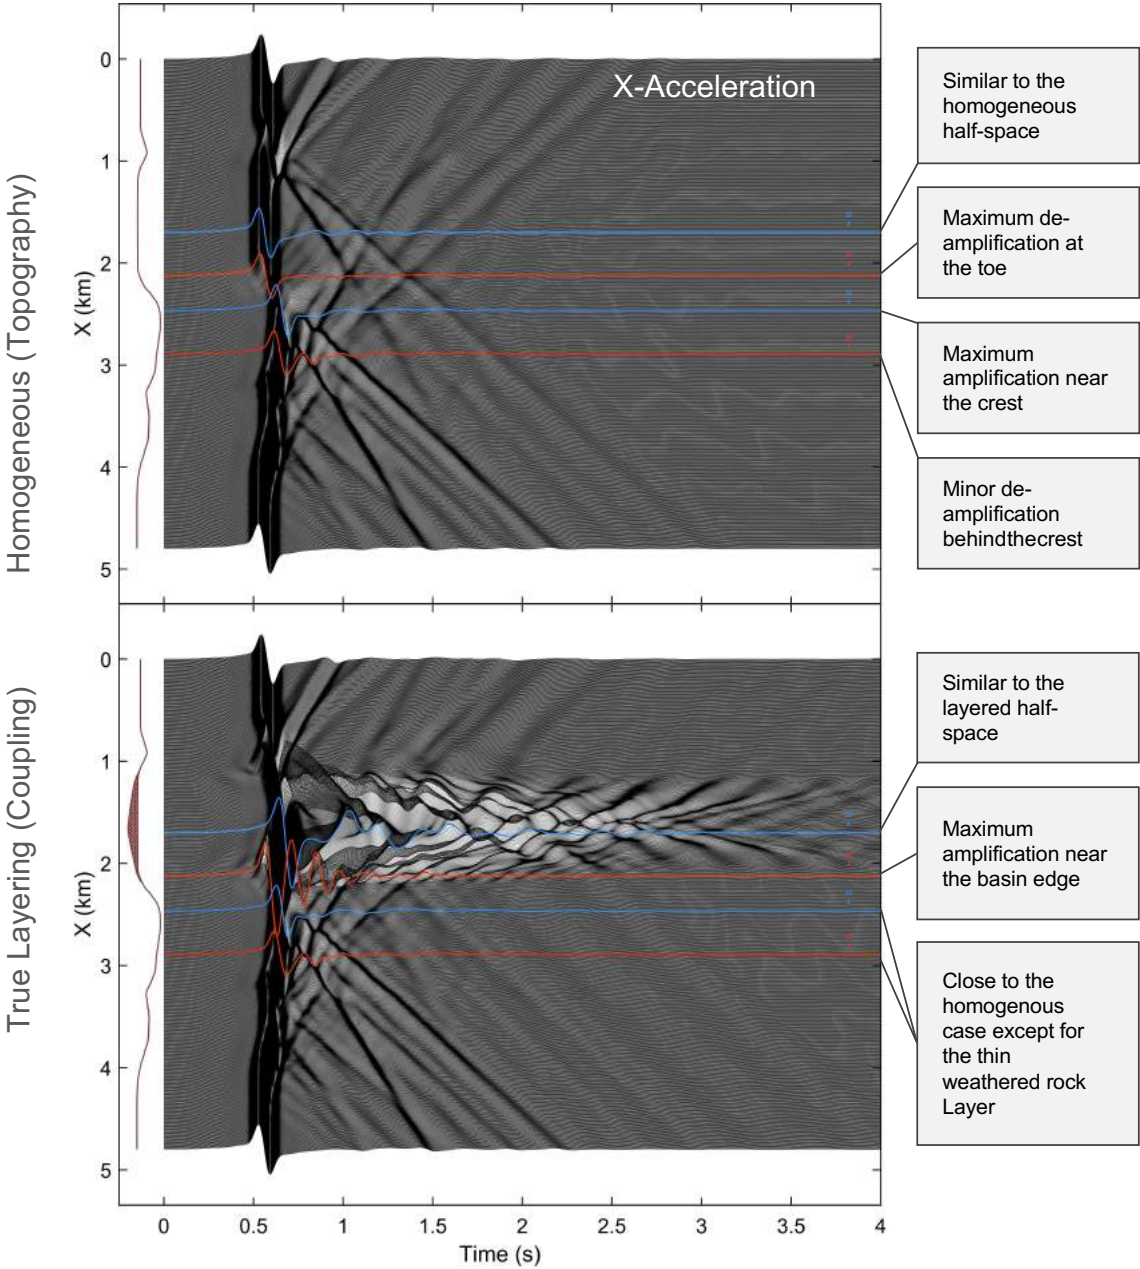

# Results from 2D Simulations

- 1: Incident SV wave reaches the scatterer i.e. the basin.
- 2: Topographic amplification occurs (low frequencies).
- 3: Over reflection, part of the energy remains in the basin.
- 4: Wave trapped in the basin starts to interfere.
- 5: Constructive interference results in higher amplification.
- 6: Surface waves travel back and forth within the basin.

# Results from Comparisons with Experiments Data

Vertical SV – Ref. S04

Vertical SV – Ref. S01

## U. Memphis – Summary of Progress and Plans

- Done:
  - Modified ISVM to provide a library for iterative single-point queries
  - Coupled the modified ISVM library with Hercules
  - Carried out a suite of 3D simulations with and without topography for a point source using  $V_{s_{\min}} = 500$  and  $100$  m/s, and  $f_{\max} = 1$  and  $2$  Hz
- In progress:
  - New set of simulations for finite-fault models of 2 earthquakes from those recorded by the experimental instrument deployment (by S. Jeong)
- Plans for this year:
  - Complete a series of 4 Hz simulations with and without topography
  - Submit a manuscript with initial results for these simulations
  - Deploy Hercules in new Cray system at NeSI
  - Compare with other simulations (e.g., SPECFEM3D)

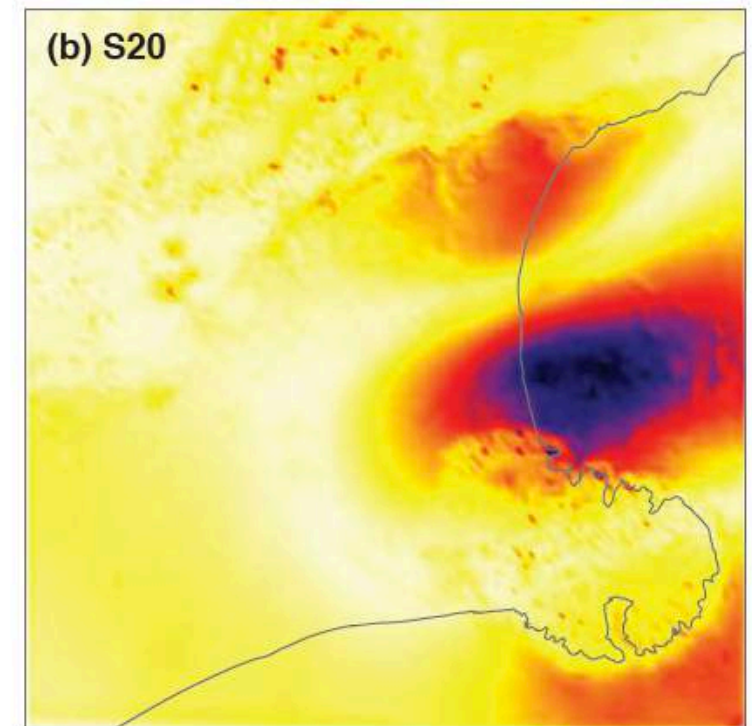

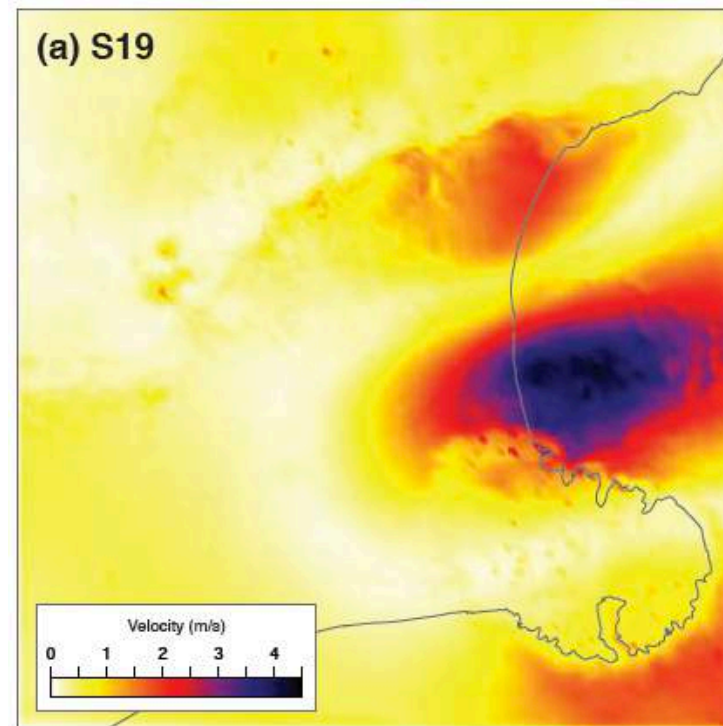

## U. Memphis Simulations Region of Interest

## U. Memphis Simulations Log

	Maximum Frequency (Hz)						Minimum Vs (m/s)		Attenuation		Surface Geometry		Completed

# U. Memphis Simulations Results from 2017

# U. Memphis Simulations Results from 2017

## U. Memphis Simulations Planned for 2018

- Two events selected from a list provided by S. Jeong
- Finite fault models generated using Graves and Pitarka source generator provided by R. Lee
- Models already converted for use in Hercules
